Welcome to the Consumer Data Research Centre (CDRC)
Millions of UK consumer data are generated each day, providing valuable insight to help organisations operate more effectively. It's not just businesses that benefit. Organisations can utilise data to make the UK a better place. Our aim is to work with organisations to open up their data to our trusted researchers so we can provide insights that drive economic growth and improve our society.

H11 What type of central heating does this accommodation have?
 Tick all that apply, whether or not you use it.
 Central heating is a central system that generates heat for multiple rooms
 No central heating
 Gas
 Electric (including storage heaters)
 Oil
 Solid fuel (for example wood, coal)
 Other central heating

H12 Does your household own or rent this accommodation?
 Tick one box only.
 Owns outright → Go to **H14**
 Owns with a mortgage or loan → Go to **H14**
 Part owns and part rents (shared ownership)
 Rents (with or without housing benefit)
 Lives here rent free

H13 Who is your landlord?
 Tick one box only.
 Housing association, housing co-operative, charitable trust, registered social landlord
 Council (local authority)
 Private landlord or letting agency
 Employer of a household member
 Relative or friend of a household member
 Other

H14 In total, how many cars or vans are owned, or available for use, by members of this household?
 Include any company car(s) or van(s) available for private use.
 None
 1
 2
 Write in number

How many rooms are available for use only by this household?
 Do NOT count:
 • bathrooms
 • toilets
 • halls or landings
 • rooms that can only be used for storage such as cupboards
 Count all other rooms, for example:
 • kitchens
 • living rooms
 • utility rooms
 • bedrooms
 • studies
 • conservatories
 Rooms converted into one, count

Inc 1 What is your name?
 First name
 Last name

2 What is your sex?
 Male Female

3 What is your date of birth?
 Day
 Month
 Year

4 On 27 March 2011, what is your legal marital or same-sex civil partnership status?
 Never married and never registered a same-sex civil partnership
 Married
 Separated, but still legally married
 Divorced
 Widowed
 In a registered same-sex civil partnership
 Separated, but still legally in a same-sex civil partnership
 Formerly in a same-sex civil partnership which is now legally dissolved
 Surviving partner from a same-sex civil partnership

5 Do you stay at another address for more than 30 days a year?
 No → Go to **7**
 Yes, write in other UK address below

 OR
 Yes, outside the UK, write in country
 Postcode

6 What is that address?
 Armed forces base address
 Another address when working away from home
 Student's home address
 Student's term time address
 Another parent or guardian's address
 Holiday home

PART 2 SOCIAL AREAS AND CLUSTERS

33 The city of Liverpool is shown divided into five types of area in figure 2

a high status area of owner occupied houses with stable families

a rooming house area of subdivided houses providing furnished privately rented accommodation chiefly for young people

the inner council estates, mainly though not exclusively the older blocks of flats

the outer council estates, mainly houses and newer blocks of flats

Table 4 Social areas: general characteristics

*ratio

an area of older terraced housing, mostly unfurnished privately rented houses many lacking an inside wc.

34 The key characteristics of each area are shown in table 4, expressed as percentages of the average for the city as a whole. Thus the ratio to the city mean for owner occupied households in the high status area is 236, meaning that 71% of all households in that area are owner occupiers as the average in the city as a whole is 30%.

35 The relative size of each social area is shown in table 5. The second and third are smaller than the others and the fourth has the largest population, the largest number of clusters and also the largest number of basic data areas. Furthermore, the average population size of basic data areas is larger in the fourth area and particularly small in the second. This implies that the outer council estates contain large tracts of housing which are socially homogeneous whereas the rooming house area is more sharply split up into small areas with different social characteristics.

36 The social areas are most strongly related with the pattern of housing tenure in the city in two important respects. Each area as a whole is characterised by a single type of tenure not only in the composition of its own housing stock but also in the extent to which it contains within its boundaries a large proportion of all houses in that category in the city. Thus the high status area contains over half the city's owner occupied houses and virtually all of its newer houses in that category. The rooming house and older terraced areas split the rest of the private houses between them, the furnished rented in one and the unfurnished rented and most of the remaining (mainly older) owner occupied houses in the other. And the inner and outer council areas contain between them virtually all of the city's council housing.

37 Another important feature of the system is that to a very large extent each social area is comparatively homogeneous in the make up of its housing stock. That is, all clusters and basic data areas in a given area are pretty similar in their housing composition, as is shown in table 1. No other characteristic is so strongly related with the system as a whole, since for no other does the amount of variation retained stay as high as for housing tenure.

38 The social areas are comparatively poorly related to the distribution of social classes in the city in the sense that

Table 5 Distribution of population, tenure and status by social area (%)

Geography and Environment

The internal structure of Greater London: a comparison of national and regional geodemographic models

Alex David Singleton¹ and Paul Longley²

Geodemographic classifications are categorical measures representing salient multidimensional population and built environment attributes of small areas. The UK Output Area Classification (OAC) is one such classification, created on behalf of the Office for National Statistics, and was built with an open methodology and entirely from 2011 Census variables. However, one criticism of national classifications such as OAC is that they do not adequately accommodate local or regional structures that diverge from national patterns. In this paper we explore this issue with respect to Greater London. We develop a London classification based upon the OAC methodology, and explore the extent to which these patterns are divergent from the national classification.

Key words London; geodemographics; clustering; regions; GIS

Revised manuscript received 3 May 2015

Introduction

A geodemographic classification aims to provide a summary of salient socio-spatial characteristics of a small area zonal geography. Presented typically as a nested categorical typology, geodemographic classifications are designed to facilitate comparison between locations, for example, highlighting similarity in patterns of population structure between different parts of a country, or inferring the attitudes of a local population by coding of much more coarsely zoned national surveys. Classifications have been developed within multiple international jurisdictions (Singleton and Spielman 2014), including, but not limited to, Italy (Willis *et al.* 2010), Finland (Takala 2014), Japan (Asai and Yano 2001), Nigeria (Ojo *et al.*, 2013), the Philippines (Ojo *et al.*, 2013), and the United States (Spielman and Thill 2008; Skupin and Esperber 2011).

Indicator measures will typically be captured from a wide range of attributes about the characteristics and behaviours of populations, alongside attributes of the built environment; and will be drawn in different balances from both the public domain (e.g. open data) and private sector sources (e.g. consumer databases etc.). A geodemographic classification is compiled through a process of cluster analysis, which is a computational technique that groups areas sharing the greatest overall similarity from within a complex of input attributes¹. As such, clusters are formed on the basis of social similarity alone, and are independent of location.

However, there are strong *a priori* reasons to anticipate that differences between regions will impede the utility of national classifications. Arranging areas into clusters optimised to represent the geography of a national extent may for example smooth away important regionally disaggregated local patterns. As such, a key motivation for creating our classification of the Greater London area independent of the rest of the UK arises out of the belief that there is something distinctively different about the geography of the UK's capital city. Such uniqueness can perhaps be illustrated most simply by comparing percentage scores for a number of 2011 Census variables selected to be illustrative of industry specialisation, economic and social diversity (see Table 1). Although these attributes might be argued as arbitrarily selected, differences such as those illustrated are also picked up in the wider literature across a range of perspectives, including but not limited to historic settlement geography

Britain's digital tribes revealed

By Jonathan Fildes
Science and technology reporter, BBC News

Households in Britain can be classified into 23 "e-types" depending on their access to technology, say researchers.

E-types include mobile explorers, the e-committed and rational utilitarians.

There are regional differences in people's access to technology.

The researchers, from University College London (UCL), say the profiles could be used to inform future policies on access to digital technology.

Every postcode in Britain has been assigned a classification which people can check online to see if they agree with the researcher's analysis.

"What really emerges is that almost all of the types have some interaction with technology," said Professor Paul Longley, who led the study at UCL. "In a sense we are all digital now"

Digital divide

CDRC Maps has been created by **Oliver O'Brien at UCL Geography.**

Important note: Classifications are an average across the local area, rather than for individual houses, therefore the colour coding on a building is not necessarily indicative of that building.

J: Residential Institutions, Young People	95	118	82	79	117	149	92	122	88	113

Challenges and Conclusions

- Geodemographic methods can be extended to consider time
 - How do we combine time periods for fixed geography?
 - Flows between clusters?
- Moving beyond domicile characteristics?

Challenges and Conclusions

- Dynamic zone design / scale
 - E.g. what is an appropriate scale / zone for residential v workplace geography?
- Data availability - representativeness & uncertainty

Many thanks...
